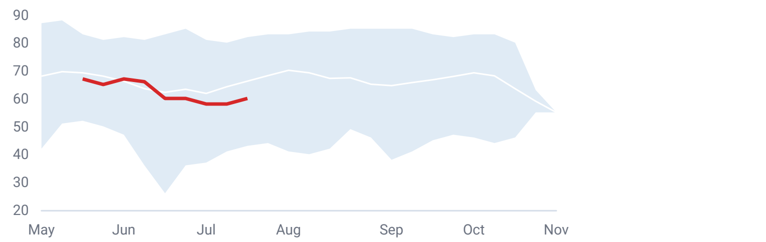
Illinois (IL)

TREND	CURRENT ✎	SUGGESTED
216	215	214

-1.0 bu vs current

G+E soft (60, −6.2 vs 10yr avg) but NDVI +4.4% shows a heavier canopy, 69% silked = pollination mostly set, and both models cool into fill (protects kernel weight); ECMWF staying dry (15%) keeps us off 215. Risk: ECMWF dry regime extending through late fill → back to 212.

CROP CONDITION · G+E — -6.2 VS NORM



NDVI VS NORMAL — +7.3%

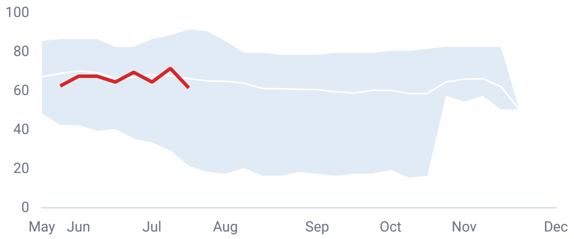
North Dakota (ND)

TREND	CURRENT ✎	SUGGESTED
153	132	132

+0.0 bu vs current

G+E fell ~10pp w/w to 61 (−4.8 vs norm) confirming sharp deterioration; only 20% silked into a hot (ECMWF +7.5°F), near-rainless (2%) 10-day on Short, rainfed soil, so ~80% of the crop pollinates into stress with no cushion. NDVI +10.6% is stale, discounted. Risk: skews lower if ECMWF hot/dry verifies through silk.

CROP CONDITION · G+E -4.8 VS NORM



NDVI VS NORMAL +9.9%
